

## PROPOSED DRAINAGE SYSTEMS

The existing surface/rainwater system is a mixture of a combined drain and soak-aways. The proposal is to utilize the existing provision, however if the existing system is not deemed sufficient to cope with the run-off from the roofs, then a secondary provision will be undertaken.

Following a permeability test, it may be necessary to provide 'retention tanks' which will allow the storage and controlled use of the water.

The existing foul drainage system will be used with new connections where required.

A new connection into the main adopted system may be required.
